Sent: To:

Spector, Lorraine Monday, July 15, 2002 1:52 PM STIC-Biotech/ChemLib

Subject:

Search request, 09/202054

Please TRANSLATE SEQ ID NO:2, and then do a word/fragment search with a word size of 6 aa. Also search SEQ ID NO:1, residues 30-836, word/fragment search with a word size of 6 aa. Need Pending, Issued, and Commercial databases for both.

Thanks.

Lorraine Spector Patent Examiner Art Unit 1647 CM1 10B-11 703-308-1793

The present invention specifically describes human DNAX toll-like receptors 2 to 10 DTLM2-10). The present sequence is human DTLM6 given in the present invention. Also described are: (1) a fusion protein comprising a DTLM protein or peptide; (2) a binding compound, preferably protein or peptide; (3) a nucleic acid encoding a DTLM protein or peptide; (4) an expression vector comprising the nucleic acid of (3); and (5) a host cell comprising the vector of (4). The host cell of (5) can be used to produce the DTLM proteins can be used to alter phosphate metabolism, to modulate inflammatory function, innate used inmunity responses or morphological effects. The DTLM proteins can be used inmunity responses or morphological effects. The DTLM proteins can be used in the treatment of conditions exhibiting abnormal expression of the receptors of their ligands. These abnormal expression of manifested by immunological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SSDFQHLSFLKCLNLSGNLISQTLNGSEFQPLAELRYLDFSNNRLDLLHSTAFEELHKLE 540

                                  The present invention describes secreted and transmembrane polypeptic and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AA233891 to AAX34338, and AAX41688 to AAX41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                        of Drosophila Tribute and acts as a pathogen pattern recognition receptor, sensing the presence of conserved molecular structures present on microorganisms. The sequence was deduced from isolated cDNA clone DNA40021-1154 (ATCC 209389) (see AAX58295).

The invention provides 3 novel cDNA clones that encode novel human roll polypeptides PRO286, PRO286 (see AAY05867) and PRO38 (see AAX05865).

AAY05868). It also provides specific antibodies and chimeric molecules comprising a PRO285, PRO286 or PRO358 polypeptide, or a transmembrane domain-deleted or inactivated variant, fused to a chercologous amino acid sequence, such as an epitope tag or immunoglobulin Fc region. Being homologues of Drosophila Toll contently particularly inflammation, septic shock, and response to manualty, particularly inflammation, septic shock, and response to the proteins involved in Toll-mediated signal transduction (e.g. arthritis and ulcers. The PRO polypeptides are used to identify arthritis and ulcers. The PRO polypeptides are used to identify carthritis and ulcers. The PRO polypeptides are used to identify carthritis and ulcers. The PRO polypeptides are used to identify carthritis and ulcers. The PRO polypeptides are used to identify carthritis and ulcers. The PRO polypeptides are used to identify carthritis and ulcers. Anthodoles specific for the PRO polypeptides (or for the PRO polypeptides) are used to identify conternate antibodies. Anthodoles specific for the PRO polypeptides.

                                                                                                                                                      AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides can be used for detecting activity. The polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                420

                                                                                                                                                                                                                                                                                                 ANUL2172-AAU12446 represent novel human secretory and transmembrane
PRO polypeptides. The PRO polypeptides are useful to detect other
PRO polypeptides, to link bloactive molecules to cells expressing
PRO polypeptides, to modulate biological activities of cells expressing
PRO polypeptides, and to detect the presence of mammalian lung, colon,
breast, prostate, rectal, cervical or liver tumours by comparing PRO
Derest, prostate, rectal, cervical or liver tumours by comparing PRO
Derest, prostate, rectal, cervical or liver tumours by comparing PRO
Derest, prostate, rectal, cervical or liver tumours by comparing PRO
Derest, prostate, rectal, cervical or liver tumours by comparing PRO
Derest, prostate, rectal, cervical or liver tumours by comparing PRO
Derest, prostate, rectal, cervical or liver to stimulate the release of
tumour necrosis factor-alpha (TNF-alpha) from human blood, the
proposition or differentiation of chondrocytes, the proliferation or gene expression in pericyte cells, the release of proteoglycans from
cartilage, the proliferation of inner ear utricular supporting cells or
cartilage, the proliferation of inner ear utricular supporting cells or
cartilage, the proliferation of inner ear utricular supporting cells or
cartilage, the proliferation of inner ear utricular supporting cells or
cartilage, the proliferation of inner ear utricular supporting cells or
cartilage, the proliferation of endothelial cells. Some of
moncytes (PBMCS), or the proliferation of endothelial cells. Some of
the PRO polypeptides may modulate glucose or free fatty acid uptake by
skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide
to factor VIIA. The PRO polypeptides can be used in assays to identify
molecules involved in binding interactions. The polynuclectides encoding
PRO polypeptides can be used to generate probes, antisense RNA/DNA,
transgenic or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              420

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human broad to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human brain expressed single exon probe encoded protein SEQ ID NO: 30447.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
cactivity, and can be used in gene therapy and vaccine production. (I)
proteins and polynuclectides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
polynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic acidis. AAK64703
to AAK87694 represent human immune/haematopoietic acidis acidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 11; SEQ ID NO 17948; 3071pp + Sequence Listing; English.

Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune prognosing disorders related to t disorders and neuronal disorders

Claim 1; SEQ ID No 972; 880pp; English.

The invention relates to novel isolated polypeptides (I), and the antibody to (J) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune (Isorders (e.g. congenital and acquired immunodeficiencies, autoimmune (Isorders (e.g. theumatoid arthritis), inflammatory conditions, organ transplant rejections and graft versus host disease, infectious diseases (e.g. thepatitis C), bleeding disorders, haemoglobin abnormalities and other blood-related disorders (aschers, primary haematopoletic disorders, hyperproliferative disorders, primary haematopoletic disorders, hyperproliferative disorders (e.g. daucher's disease, Parkinson's disease), chromosomal abnormalities (Down syndrome), ischaemic injury (e.g. stroke), renal disorders (e.g. glomerulonephritis), cardiovascular disorders (e.g. disorders (e.g. glomerulonephritis), cardiovascular disorders (e.g. disease), reproductive system disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders, in wound healing, epithelial cell proliferation, endocrine disorders, as stimulators of B-cell responsiveness to pathogens, activators of theories (alsorder finflammatory disorders), liver disorders, cirrhosis), cas stimulators of B-cell responsiveness to pathogens, activators of the unour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). AAU17059-AAU17083 represent novel signal transduction contacts of the pathway protein, amino acid sequences of the invention.

Human polypeptide SEQ ID NO 244.
                            22-OCT-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human polynucleotides (AAIG3803-AAIG4012) and the encoded proteins (AAM434497-AAM43660) useful for preventing, treating cor ameliorating medical conditions e.g. by protein or gene therapy. The genes were isolated from a range of human tissues disclosed in the genes were isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, or over an overlan cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital: (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyproiditis, diabetes mellitus, colnis disease, multiple sclerosis, rheumatoid arthritis and ulcerative (d) wound healing: (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases such as viral, bacterial, fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     useful for diagnosing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 161;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 11; SEQ ID NO 319; 664pp + Sequence Listing; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acids and polypeptides, useful for treating and/or preventing human diseases and disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5.1%; Score 41; DB 22; I

The invention relates to human polynuclectides (AAI63803-AAI64012) and the encoded proteins (AAM43447-AAM43660) useful for preventing, treating cor amelibrorating medical conditions e.g. by protein or gene therapy. The genes were isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, c. g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune heamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNAX toll-like receptor; DTLR; Drosophila toll receptor; IL-1 receptor; interleukin 1 receptor; phosphate metabolism; innate immunity response; modulate inflammatory function; morphological effect;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention specifically describes human DNAX toll-like receptors 2 tol 0 DTLR2-10). The present sequence is mouse DTLR6 given in the present invention. Also described are: (1) a fusion protein comprising a DTLR protein or peptide; (2) a binding compound, a DTLR protein or peptide; (3) a nucleic acid encoding a DTLR protein or peptide; (3) a nucleic acid encoding a DTLR protein or peptide; (4) an expression vector comprising the nucleic acid of (3); and (5) a host cell comprising the vector of (4). The host cell of (5) can be used to preduce the DTLR proteins can be used to alter phosphate metabolism, to modulate inflammatory function, innate immunity responses or morphological effects. The DTLR proteins can be used in the treatment of conditions exhibiting abnormal expression of the receptors of their ligands. These abnormalities are typically manifested by immunological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide hormone; antidiabetic; anorectic; antianorectic; antiasthmatic; antidepressant; nootropic; neuroprotectant; hypotensive; hypertensive; cytostatic; cerebroprotective; vasotropic; human.
                                                                                                                                                                                                              Human DNAX toll-like receptors, DTLR 2-10 - used to, e.g. alter phosphate metabolism, modulate inflammatory function or innate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DXX PC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention specifically describes human DNAX toll-like receptors 2 to 10 (DTLR2-10). The present sequence is mouse DTLR6 given in the present invention. Also described are: (1) a fusion protein comprising a DTLR protein or peptide; (2) a binding compound, preferably an antibody or antibody fragment which specifically binds to peptide; (4) an expression vector comprising the nucleic acid of (3); and (5) a host cell comprising the vector of (4). The host cell of (5) can be used to produce the DTLR proteins. The DTLR proteins can be used immunity responses or morphological effects. The DTLR proteins can be used in the treatment of conditions exhibiting abbornmal expression of their ligands. These abbornmal expression of the proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNAX toll-like receptor; DTLR; Drosophila toll receptor; LL-1 receptor; interleukin 1 receptor; phosphate metabolism; innate immunity response; modulate inflammatory function; morphological effect;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides polypeptides (AAG65886-65918) which may be peptide hormones (including insulin, growth hormones, chemokines, cytokines, neuropeptides, integrins, kallikreins, lamins, melanins, nattuireties, neuropeptides, integrins, kallikreins, lamins, melanins, nattuireties, neuropeptides, printiary hormones, pleiotrophins, prostaglandins, secretogranins, selectins, thromboglobulins, thymosins) identified by high throughput genome-based biology and polynucleotides (AAI67176-67208) encoding them. The polypeptides can be expressed by standard recombinant methodology. The polypeptides are useful in the treatment of disease such as dlabetes, breast-, prostate-, colon cancer and other malignant tumors, hyper- and hypotension, obesity, bulimia, anorexia, growth abnormalities, asthma, manic depression, dementia, delitium, mental retardation, the samual development disorders, and dysfunctions of the blood cascade system including those leading to stroke. The polypucleotides may be used as diagnostic reagents through detecting mutations in the associated gene and for chromosome localization and for tissue expression studies. The polypeptides and polynucleotides may also be used as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide hormone; antidiabetic; anorectic; antianorectic; antiasthmatic; antidepressant; nootropic; neuroprotectant; hypotensive; hypertensive; cytostatic; cerebroprotective; vasotropic; human.

hormones (including insulin, growth hormones, chemokines, cytokines, neuropeptides, integrins, kallikreins, lamins, melanins, natruiretic hormones, neuropeptides, integrins, kallikreins, lamins, melanins, natruiretic hormones, neuropeptides, integrins, high melanins, natruiretic hormones, neuropepsin, pituitary hormones, pleiotrophins, prostaglandins, secretogranins, selectins, thromones, pleiotrophins, prostaglandins, high throughput genome-based biology and polynucleotides (AAIG7176-67208) encoding them. The polypeptides can be expressed by standard recombinant methodology. The polypeptides are useful in the treatment of disease such as diabetes, breast, prostate, colon cancer and other malignant tumors, hyper- and hypotension, obesity, bulimia, anorexia, growth abnormalities, asthma, manic depression, dementia, delirium, mental retardation, Huntington's disease, Tourette's syndrome, schizophrenia, growth, mental or sexual development disorders, and dysfunctions of the blood cascade system including those leading to stroke. The polynucleotides may be used as diagnostic reagents through detecting mutations in the associated gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; leucine-rich repeat protein-like; LRR; cytostatic; gene therapy; HIV; Human Immunodeficiency Virus; haemophilia; bleeding disorder; mycozrdial infarction; thrombosis; atherosclerossis; glomerular disease; angioplasty-related restenosis; viral infection; rhemmatoid arthritis; multiple sclerosis; psoriasis; systemic lupus erythematosus; burn, ulcer; inflammatory bowel disease; wound healing; cancer; Alzheimer's disease; Parkinson's disease; erebrovascular disease; stroke; HIV; fibrosis; author; nephritis; Crohn's disease; anaphylaxis; hypersensitivity; acute pancreatitis; diabetes mellitus; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides polypeptides (AAG65886-65918) which may be peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and for chromosome localization and for tissue expression studies. The polypeptides and polynucleotides may also be used as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                   Isolated polypeptides, which may be peptide hormones, which are identified by high throughput genome-based biology which identifies genes and gene products as therapeutic targets for treatment of diseases such as diabetes and cancer

sequence which corresponds to residues 222.265 of LRR protein.

LRR protein is involved in protein recognition, cell adhesion, development, signal transduction, DNA and protein are useful for treating responses and transcription. LRR DNA and protein are useful for treating, preventing haemophilia, bleeding disorders (Bernard-Soulier syndrome).

Mycoardial infarction, thrombosis, atheroscienceis, glomerular diseases, amyocardial infarction, thrombosis, atheroscienceis, glomerular diseases, immunological disorders (rheumatoid arthritis, multiple sclerosis, psorialsis, systemic lupus erythematosus, inflammatory bowel disease, periodontiis); wound healing, burns, ulcers, incisions and cancer.

LRR is also useful for proliferation of neural cells and nerve response tration, for treating peripheral nervous system diseases (central nervous system diseases (Alzheimer's, Parkinson's disease, Huntington's disease, mayotrophic lateral sclerosis and Shy-Drager syndrome); mechanical and traumatic disorders (spinal cord disorders, head trauma) credents and traumatic disorders (spinal cord disorders, head trauma) in the strain associated with infection (septic shock, sepsis or systemic inflammatory response syndrome (SIRS)), isochember the propriet of inflammatory contractions injury, income the propriet of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              endotoxin lethality, arthritis, complement mediated hyperacute rejection, nephritis, cytokine or chemokine-induced lung injury, Crohn's disease, anaphylaxis, hypersensitivity, acute pancreatitis, endotoxin shock, chronic inflammatory arthritis, pancreatic cell damage from diabetes mellitus type 1, graft versus host disease, inflammation associated with pulmonary disease, other autoimmune diseases or inflammatory diseases.
                                                                                                                                                                                                                                      Novel leucine-rich repeat protein-like polypeptides and polynucleotides for diagnosing, treating bleeding disorders, myocardial infarction, atherosclerosis, angioplasty-related restenosis and glomerular diseases

Novel leucine-rich repeat protein-like polypeptides and polynucleotides for diagnosing, treating bleeding disorders, myocardial infarction, atherosclerosis, angioplasty-related restenosis and glomerular diseases

Claim 12; Page 110; 156pp; English.

The invention relates to human leucine-rich repeat (LRR) protein-like

DNA and protein. LRR protein is involved in protein recognition, cell
adhesion, development, signal transduction, DNA repair, recombination,

Immune responses and transcription. LRR DNA and protein are useful for

treating, preventing haemophilia, bleeding disorders (Bernard-Soulier

Syndrome), mycorafdial infarction, thrombosis, atheroscierosis, glomerular

cliseases, angioplasty-related restancis, wiral infections, melanomas,

immunological disorders (rheumatoid arthritis, multiple sclerosis,

sporiasis, systemic lupus erythematosus, inflammatory bowel disease,

periodontitis); wound healing, burns, ulcers, incisions and cancer.

LRR is also useful for proliferation of neural cells and nerve

crepencation, for treating peripheral nervous system diseases, Huntington's

disease, amyotrophic lateral sclerosis and Shy-Drager syndrome):

nervous system diseases (Alzheimer's, Parkinson's disease, Huntington's

disease, amyotrophic lateral sclerosis and Shy-Drager syndrome):

crebrovascular diseases (stroke); HIV, lung or liver fibrosis,

inflammatory response syndrome (SIRS)), ischaemia-reperfusion injury,

endotoxin lethality, arthritis, complement-mediated hyperacute rejection,

nephylaxis, hypersensitivity, acute pancreatitis, endotoxin shock,

Claim 12; Page 151-153; 156pp; English.

```
The present sequence is a fragment of human leucine-rich repeat

(LRR) protein. LRR protein is involved in protein recognition, cell

adhealon, development, signal transduction, DNA repelir, recombination,

cathealon, development, signal transduction, DNA repelir, recombination,

immune responses and transcription. LRR DNA and protein are useful for

treating, preventing haemophilia, bleeding disorders (Bernard-Soulier

syndrome), mycocardial infarction, thrombosis, atheroscierosis, glomerular

cliseases, angloplasty-related restenosis, viral infections, melanomas,

immunological disorders (rheumatoid arthritis, multiple sclerosis,

cliseases, sundoplasty-related restenosis, viral infections, melanomas,

comperiodontitis); wound healing, burns, ulcers, inclisions and cancer.

CLRR is also useful for proliferation of neural cells and nerve

CC LRR is also useful for proliferation of neural cells and nerve

CC regeneration, for treating peripheral nervous system disease,

cc repertating nervous system diseases (Alzhaimer's, Parkinson's disease, Huntington's

disease, amyotrophic lateral sclerosis and Shy-brager syndrome);

cc disease, amyotrophic lateral sclerosis and Shy-brager syndrome);

cc disease, amyotrophic stroke); HIV, lung or liver fibrosis,

irritation associated with infection (septic shock, sepsis or systemic

crerebrovascular diseases (Stroke); HIV, lung or liver fibrosis,

irritation associated with infection (septic shock, sepsis or systemic

confortoxin lethality, arthritis, complement-mediated hyperacute rejection,

comphritis, cytokine or chemokine-induced lung injury, cronn's disease,

chaphylatash, phypersensitivity, acute pancreatitis, endotoxin and publicates

cc anaphylatash, phypersensitivity, acute pancreatitis, endotoxin and publicated with

Sequences AAU29024-AAU2932B represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNE) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectral, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Godowski PJ, Gurney AL;

cerebopment, signal transduction, DNA repair, recombination, immune responses and transcription. LRR DNA and protein are useful for treating preventing haemophilia, bleeding disorders (Bernard-Souler syndrome), myccardial infarction, thrombosis, atherosclerosis, glomerular diseases, amgioplasty-related restenosis, viral infections, melanomas, communicodical disorders (rheumatoid arthritis, multiple sclerosis, systemic lupus erythematosus, inflammatory bowel disease, periodontitis); wound healing, burns, ulcers, incisions and cancer. LRR is also useful for proliferation of neural cells and nerve regeneration, for treating peripheral nervous system diseases, central nervous system diseases (Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis and Shy-Drager syndrome); cerebrovascular diseases (Stroke); HIV, lung or liver fibrosis, irritation associated with infection (septic shock, sepsis or systemic inflammatory response syndrome (SIRS)), ischaemia-reperfusion injury, conductoxin lethality, arthritis, complement-mediated hyperacute rejection, emphritis, cytokine or chemokine-induced lung injury, Crohn's disease, chronic inflammatory rathritis, pancreatic cell damage from diabetes controlic inflammatory arthritis, pancreatic cell damage from diabetes controlic mellitus type 1, graft versus host diseases, inflammation associated with mellitus species or inflammation associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               multiple sclerosis; psoriasis; systemic lupus erythematosus; burn; ulcer; inflammatory bowel disease; wound healing; cancer; Alzheimer's disease; parkinson's disease; crebrovascular disease; stroke; HIV; fibrosis; lung; liver; nephritis; Crohn's disease; anaphylaxis; hypersensitivity; acute pancreatitis; diabetes mellitus; autoimmune disease.

AAW86356

```
The present sequence is human leucine-rich repeat (LRR) protein.

LRR protein is involved in protein recognition, cell adhesion, development, signal transduction, DNA repair, recombination, immune responses and transcription. LRR DNA and protein are useful for treating, preventing haemophilia, bleeding disorders (Bernard-Souler syndrome), angioplasty-related restenosis, viral infections, andanomas, andanomas, andalopasty-related restenosis, viral infections, melanomas, monological disorders (Theumatoid arthritis, multiple sclerosis, psortalists, systemic lupus erythematosus, inflammatory bowel disease, periodontitis); wound healing, burns, ulcers, incisions and cancer.

LRR is also useful for proliferation of neural cells and nerve regeneration, for treating peripheral nervous system diseases, duntington's disease, amyotrophic lateral sclerosis and Shy-Drager syndrome); merhanical and traummatic diseases (Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis and Shy-Drager syndrome); merhanical and traummatic diseases (stroke); HIV, lung or liver fibrosis, inflammatory response syndrome (SIRS)), ischeamia-reperfusion injury, endotoxin lethality, arthritis, compelement-mediated hyperscute rejection, nephritis, cytokine or chemokine-induced lung injury, choditis, hypersensitivity, acute pancreatitis, endotoxin shock, anaphylaxis, hypersensitivity, acute pancreatitis, endotoxin shock, chronic inflammatory arthritis, pancreatic cell damage from diabetes mellitus type 1, graft versus host diseases, inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel leucine-rich repeat protein-like polypeptides and polynucleotides for diagnosing, treating bleeding disorders, myocardial infarction, atherosclerosis, angioplasty-related restenosis and glomerular diseases
                                                                                                                                                                                                                                                                                                                                                                                                                             Liu C;

The present sequence is partial human DTLR7 given in the present invention. Also described are: (1) a fusion protein comprising a DTLR protein or peptide: (2) a binding compound, preferably an antibody or antibody fragment which specifically binds to a DTLR protein or peptide: (3) a nucleic acid encoding a DTLR protein or peptide: (4) an expression vector comprising the nucleic acid of (3); and (5) a host cell comprising the vector of (4). The host cell of (3); can be used to produce the DTLR proteins and be used to alter phosphate metabolism, to modulate inflammatory function, innate used inmunity responses or morphological effects. The DTLR proteins can be used in the treatment of conditions exhibiting abnormal expression of the receptors of their ligands. These abnormalities are typically manifested by immunological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ő

The polynucleotide sequences given in AAP33213 to AAF33261 encode the human secreted proteins given in AAB64882 to AAB64930. AAB64931 to AAB64931 represent human secreted polypeptide sequences and proteins condeciles the genes are given in the exemplification of the proteins of homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in the examples of activities include: Immunomodulatory; antisclerotic; dermatological; immunosuppressive; antinflammatory; anti-HIV; immunostimulant; cytostatic; cardiant; cardinaris antinflammatory; anti-HIV; immunostimulant; cytostatic; cardiant; cardinaris antinflammatory; anti-anglogenic; optibalmers; cardiant; coursprotectant; anticonvulsant; nockropic; antialzheimers; antimulanticrobial; anti-anglogenic; optibalmers; cardiant; cardiant; and vulnerary. The polynucleotides and polypeptides can be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. Disorders that may be prevented, diagnosed and/or treated by the above methods include immune call disorders (e.g. cancers and Gaucher's disease), hyperproliferative disorders (e.g. cancers and Gaucher's disease), cardiovascular diseases cardianticon, chaqa s cardiomyopathy and coronary arteriosclerosis), anglogenic disorders (e.g. corneal graft neovascularisation and diabetic retinopathy; neurological disorders (e.g. Huntington's chorea, Alzheimer's disease and Parkinson's disease), infectious diseases and/or for promoting wound healing, regeneration and chapter corneal graft sequences and/or for promoting wound healing, regeneration and chapter corneal graft sequences and or chemotaxis. AAR532304 to AAR53212 and AB64881 represent sequences Claim 11; Page 489-490; 554pp; English.

marrow-derived polypeptides. The partie amang exhibit e.g., cytokine or stem cell growth factor activity and may be useful for re-engineering damaged or diseased tissues, producing large quantities of human cells to treat parkinson's, Alzheimer's and other neurodegenerative diseases, cound healing, immune system stimulation or suppression, treating autoimmune diseases, and cancer. The corresponding nucleic acid sequences can be used to express recombinant protein for analysis, characterisation or therapeutic use; as markers for tissues in which the corresponding protein is preferentially expressed; as a molecular weight marker on cypls; as chromosome markers or tags; as probes to hybridise and discover novel, related DNA sequences; as a source of information to derive polymerase chain reaction (PCR) primers; for selecting and making oligomers for attachment to a 'gene chip' or other support; to raise anti-protein antibodies using DNA immunisation techniques; and as an anti-proteins may be also used as a nutritional source.
                                                                                                                                           nootropic; neuroprotective; therapeutic; antigenic; nutritional source; cytokine; stem cell growth factor; tissue regeneration: cancer; Parkinson's disease; Alzheimer's disease; neurodegenerative disorder; wound healing; immune system; autoimmune disease.
                                                                                                                            Bone marrow; immunosuppressive; immunostimulant; cytostatic; vulnerary;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotides encoding bone marrow-derived polypeptides useful for treating, e.g., cancer, autoimmune disease and Alzheimer's disease

The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placents. The probes are useful for antenatal diagnosts of
                                                                                                            Peptide #5178 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; PRO: EST; expressed sequence tag; PCR primer; hybridisation; probe; blood coagulation disorder; cancer; cellular adhesion disorder; secreted protein; transmembrane protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes for ameasuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: Thythmias and congenital heart disease.

Note: The sequence data for this patent did not form part of the printed procession, both was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                 Protein #5026 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single exon nucleic acid probes for analyzing gene expression in human hearts -

The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AA233891 to AA234338, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                        New secreted and transmembrane polypeptides and their polynucleotides, useful for treating blood coagulation disorders, cancers and cellular adhesion disorders -

                                                                                                                                                                                                                                                                               This is the amino acid sequence of PRO286, a novel human homologue of Drosophila Toll protein, that acts as a pathogen pattern recopontion receptor, sensing the presence of conserved molecular structures present on microorganisms. The sequence was deduced from isolated cDNA clone DNA4263-1154 (ATCC 209386) (see AAX58296). The invention provides 3 novel cDNA clones that encode novel human Toll polypeptides PRO286 (see AAY05868). It also provides specific antibodies and chimeric molecules comprising a PRO285, PRO286 or PRO358 polypeptide, or a transmembrane domain-deleted or inactivated variant, fused to a
                                                                                                                                                                                                                                                                                                                                                                                                                                               heterologous amino acid sequence, such as an epitope tag or immunoglobulin Fc region. Being homologues of Drosophila Toll protein, the 3 human proteins are likely to be involved in adaptive pathogens in diseases aggravated by the immune response, and response to pathogens in diseases aggravated by the immune response, such as diabetes, amyotrophic lateral sclerosis, cancer, rheumatoid arthitis and ulcers. The PRO polypeptides are used to identify other proteins involved in Toll-mediated signal transduction (e.g. natural ligands), to screen for receptor and ligand minitos, and to generate antibodies. Antibodies specific for the PRO polypeptides (e.g. for the known receptor TLR-2) are used to treat septic shock
                                                                                                                                                                                                                  New human Toll-like receptors that recognize microbial structures

                                                                                                                                                                                                                                                                                                                                                                                                                        The peptide corresponds to residues 81-95 of the N-terminus of glycoalicin, a water sol. proteolytic fragment of GPIb alpha. It may be linked to a second peptide from the 45 kD N-terminal tryptic fragment of GPIb alpha. The peptide inhibits binding of VWF to GPIb. It can be used to inhibit activation, aggregation and/or adhesion of platelets, esp. for inhibition of thrombosis. See also AAR13128-R13138.
                                                                                                                                                                                                                                                                                                                    GPIb alpha peptide fragment - inhibits binding of von Willebrand factor to platelet membrane glyco-protein Ib, useful in treating
                                                                                                                                                                                                                                    Houghten RA, Vicente V,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polypeptides. The PRO polynucleotides and polypeptides can be used for detecting activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bloactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide pairs provide specific targeting of bloactive molecules to cells. AAC78600 to AAC78987 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                        The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, mamunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the Activity, the activities such as: Immune system suppression, Activinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, accenting and thrombolytic activity, arthritis and inflammation, leukaemias and

AAC77607 to AAC7848 encode the human cancer associated proteins given tissues and cells the genes are expressed in. Example of activities based on the tissues and cells the genes are expressed in. Example of activities antidade: cytostatic; proliferative; vulneary; immunomodulator; antidabetic; antiarthrituc; antitarhrituc; antidabetic; antiparithyroid; antidabetic; antiparity; antidamatory; antiparithyroid; antidation; thrombolytic; coagulant; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antiparities can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Colynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Colynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation of hamme cells, to treat disorders of haematopoletic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate disorders, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to the present sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; secreted protein; immunestimulant; immunesuppressant; virucide; antibacterial; antifungal; cytostatic; antiinflammatory; dermatological; antibacthantic; antiarthritic; antirheumatic; protozoacide; antithyroid; immune deficiency; severe combined immunedeficiency; SCID; infection; HIV; hepatitis; malaria; autoimmune disorder; systemic lupus; connective tissue disease; multiple sclerosis; erythematosis; rheumatorid arthritis; autoimmune pulmonary inflammation; asthma; Guillain-Barre syndrome; autoimmune thyroiditis; myasthenia gravis; autoimmune inflammatory eye disease; allergy.

AAY AAA16618 to AAA16697 encode the human secreted proteins given in AAY94898 to AAY94980, isolated from human adult brain, adult thyroid, adult placenta, adult teating, adult testing, dectal carcinoma, adult blood, adult neural, foetal kidney, adult placenta, adult testing, whole embryo, adult uterus, adult tumour, and adult bladder, convalidation adult uterus, adult tumour, foetal brain, adult thymus, foetal placenta, adult uterus, adult tumour, and adult bladder, convalidations. The polynuclectides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and and animals. The polynuclectides can be used as markers for tissues in which the protein is preferentially expressed, as molecular weight markers on Southern gels, and as chromosome markers or tags to identify cromosomes or to map gene postitions. The proteins can be used in the treatment of immune deficiencies and disorders, such as severe combined immunedeficiency (SCID), as well as viral, bacterial, fungal and other of forforms. These infections include human immunodeficiency virus (HIV), hepatitis, herpesviruses, mycobacteria, Leismania spp., malaria and candidiasis. The proteins can be used to treat autoimmune disorders such candidiasis. The unatoid arthritis, autoimmune pulmonary inflammation, cautoimmune thyroiditis, insulin dependent cautoimmune inflammatori erreat multiples clerosis, systemic lupus cautoimmune inflammatory eye disease. The proteins can also be used to treat autoimmune secreted proteins from the present invention.

Culliain Barre syndrome, autoimmune thyroiditis, insulin dependent cautoimmune secreted proteins from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotides encoding secreted proteins, which may have e.g. untritional, chemokine, immune stimulating or suppressing, hematopoiesis regulating, tissue growth, activin/inhibin antlinflammatory or tumor inhibition activity
                                                                                                                                                                                                                                                                                                                                                                                                    Steininger RJ, Spaulding V;

The polynucleotide sequences given in AAF33213 to AAF33261 encode the human secreted proteins given in AAB64882 to AAB64930. AAB64931 to AAB64931 represent human secreted polypeptide sequences and proteins conditions to them, which are given in the exemplification of the proteins have activities based on the tissues of activities based on the tissues condition. Human secreted proteins have activities based on the tissues conditions antisolarory; antisolarotic; dermatological; immunosuppressive; antinflammatory; anti-HIV; immunostimulant; cytostatic; cardiant; contininiorobial; anti-anglogenic; ophthalmological; cardiant; continiorobial; anti-anglogenic; ophthalmological; cardiants and prevented, diagnosed and/or treated by the above methods include immune continiorobial cancers and Gaucher's disease, cardiovascular diseases continiorobial cancers and Gaucher's disease, cardiovascular diseases continiorobial cancers and Gaucher's disease, cardiovascular diseases and/or for promoting wound healing, represent sequences content and the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 227;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1.1%; Score 9; DB 22;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Active fragments of decorin (full-length coding sequence AAQ50046) were generated by PCR and fused to Maltose Binding Protein. The resulting fusion proteins were useful for inhibiting the activity of a cell regulatory factor, esp. TGF-beta, and hence for treating conditions associated with over-activity of the growth factor such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (agonists and antagonists) of the expression and activity of the secreted agonists and antagonists) of the expression and activity of the secreted down regulate expression and activity of (II) antibodies and antagonists may also be used to down regulate expression and activity of (II). The anti-(II) antibodies may also be used as diagnostic agents for detecting the presence of (II) in samples (e.g. by enzyme linked immunosorbant assay (ELISA). The disorders include for example: immunosorbant assay (ELISA). The (human immunodeficiency virus) infections, anaemia, rheumatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. melanomas, neoplasms of the breast or liver, Seczary syndrome and Gaucher's disease), neurological diseases (e.g. Alzhaimer's disease, parkinson's disease and Charcot-Marie-Tooth disease), cardio-/
                                      encoding human secreted proteins (II). (i) and (II) are used to prevent, treat or ameliotate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. (i) and (II) may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate expression of secreted proteins. (i) and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and so which patients may be in need of restorative therapy. (II) may also be used as antigens in the production of antibodies and in assays to identify modulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            healing, maintain organs before transplantation, and support cell culture of primary tissues. AAU20342-AAU20666 represent human secreted protein amino acid sequences, and related sequences of the invention.

Note: The sequence data for this patent did not appear in the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cerebrovascular disorders (e.g. cardiac arrest, tachycardia, angina and thrombosls), infections caused by bacteria, viruses and fundi and ocular disorders (e.g. corneal infections). (I) and (II), agonists, antagonists and antibodies can also be used to promote wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specification but was obtained in electronic format directly from WIPO at: ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
The invention relates to novel isolated nucleic acid molecules (1)

                                                                                                                                                                                                                                                                                                                                                                    Active fragments of decorin (full-length coding sequence AAQ50046) were generated by PCR and fused to Maltose Binding Protein. The resulting fusion proteins were useful for inhibiting the activity of a cell regulatory factor, esp. TGF-beta, and hence for treating conditions associated with over-activity of the growth factor such as certain tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The claim is for a peptide of a 45kD amino terminal tryptic fragment of glycocalicin selected from the sequence which inhibits binding of won Willebrand factor to platelet membrane glycoprotein 1b and related molecules or other cells and cell matrices. Also claimed are a sequential subset of the above (Claim 2) and specific peptides (see FT) (Claim 3) with the same functions and any peptide of any sequential subset of any acids of the sequence (Claim 4). The peptides and derivs, prevent platelet aggregation and inhibit thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Active fragments of decorin (full-length coding sequence AAQ50046) were generated by PCR and fused to Maltose Binding Protein. The resulting fusion proteins were useful for inhibiting the activity of a cell regulatory factor, esp. TGF-beta, and hence for treating conditions associated with over-activity of the growth factor such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Purificn. of human recombinant decorin - using a strong anion exchange resin, a hydrophobic interaction chromatography resin and a strong anion exchange resin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human recombinant decorin (AAR89439) was obtd. by expression of a cDNA clone (AAT10741) in CHO host cells. Decorin (or PGII or PG-40) is a proteoglycan having a 40 kba core protein. Recombinant decorin can be produced by cotransfection of CHO-DG4 cells with pSV2-decorin and pSV2dhfr. Large-scale cultures can be performed using CHO cells attached to microcarrier beads. The recombinant protein is purified from the cells using a 3-step chromatographic procedure. It can be used for the highly sensitive detection of guanidinium ions (ppm range), partic. In protein-contg. solns.

These peptides and proteins are used in the method of the invention which involves administering an NTTA as an autigen based immunotherapeutic agent, to a host afflicted with an autigen based immunotherapeutic agent is used to treat autoimmune disease. The immunotherapeutic agent is used to treat autoimmune diseases such as insulin dependent diabetes mellitus, multiple sclerosis, autoimmune typrofitis, uveoretinitis, neumatory autoimmune diseases such as insulin dependent diabetes. The NTTA induces regulatory tolerance by elicitation of regulatory T cells among T cells recognizing the NTTA but corresponses. The NTTA but correspondent in the immune response. The NTTA accopaling in the immune communitied T cells which can be primed, or biased, towards regulatory responses to provide effective creoponses even when target determinants used as agents promoting tolerance agents have falled to induce an effective regulatory T cell
                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Neglected target tissue antigen; NTTA; autoimmunity; autoimmune response; immunotherspeutic agent; insulin dependent diabetes mellitus; multiple sclerosis; autoimmune thyroiditis; rheumatoid arthritis; uveoretinitis; inflammatory response.

NAME OF THE OF T

359 AA;

Sequence

```
The invention relates to the inhibition of transforming growth

factor-beta (TGF-beta) activity involving contacting TGF-beta with a

purified polypeptide comprising leucine-rich amino acid sequence of a

member of decorin superfamily of mammalian proteoglycans. The following

activities can be attributed to the polypeptide of the invention:

cytostatic, nephrotrople, antirheumatic, antiarthritic, vasotrople,
antiarteriosclerotic, hepatotrople, cardiant, dermatological and

vulnerary. Polypeptides of the invention act as transforming growth

caused for treating a pathology, particularly proliferative pathology

caused by a transforming growth factor-beta (TGF-beta) regulated

activity such as cancer; particularly fibrotic cancer, fibrotic

disease, glomerulonephritis, rheumatoloid arthritis, arteriosclerosis,

adult respiratory distress syndrome, cirrhosis of liver, fibrosis of

lungs, post-myocardial infarction, cardiac fibrosis, post-angloplasty
                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of decorin or biglycan polypeptide for inhibiting TGF-beta activity in the treatment of dermal wounds and cancer

Sequences AAF23420 - AAF23450 represent primers and probes used in the isolation and characterisation of the SECX DNA sequences of the invention. The new polypeptides and nucleic acids can be used in screening assays, detection assays, preventive or predictive medicine, therapeutic and prophylactic treatment, and pharmacogenomics. Specifically, the SECX Polypeptides and nucleic acids are useful for treating cancer; other disorders related to angiogenesis e.g. abnormal wound healing, psoriasis; neurodegenerative diseases; and tissue hypertrophy (e.g. benign prostatic hypertrophy); allergic reactions and conditions such as asthma and other respiratory problems; as well as in treating or preventing diseases associated with organ
restenosis, renal interstitial fibrosis and certain dermal fibrotic conditions such as keloids and scarring resulting from burn injuries; other invasive skin injuries and reconstructive surgery. The wounds treated with the polypeptide, particularly decorin exhibit no detectable scarring, and are histologically normal. The current sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New SECX polypeptides and nucleic acids useful for treating or preventing cancer, other disorders related to anglogenesis, neurodegenerative diseases, autoimmune disorders and allergic reactions

ö
transplantation, atherosclerosis-associated diseases or disorders. The polypeptides can also be used for bone, cartilage, tendon, ligament and/or tissue growth or regeneration, wound healing, tissue repair and replacement, gut protection or regeneration, as a contraceptive, to inhibit thromboses, infections caused by bacteria, virus, fungl and other parasites, and as a vaccine. SECX antibodies may be used to isolate or detect SECX proteins, monitor protein level in tissue as part of a clinical testing procedure, treat proliferative disorders including tumours and benign hyperplasias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosls; Shy-Drager Syndrome; chemotactic; chrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ۵

A method has been developed for the detection of binding between the von Willebrand factor and glycoprotein Ib or of the binding inhibition, in which the von Willebrand factor immobilised in a reactor reacts with glycoprotein Ib in the presence of a binding inducer to promote binding between the von Willebrand factor and glycoprotein Ib. This method is for the detection of glycokallidin as a means of thrombotic disease diagnosis e.g. for cardiac infarction and cerebral embolism, and also for screening substances with anti-thrombotic activity for the prevention and treatment of thrombotic diseases. The method is direct, convenient and quantitative, with reproducibility, and there is no need to construct a monoclonal antibody for the assay. The present sequence is a human glycoprotein Ib/mouse immunoglobulin gamma I Fc chimeric protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glycoprotein Ib; glycokallidin; detection; antithrombotic; binding; von Willebrand factor; bottrocetin; chimeric protein; immunoglobulin; thrombotic disease; diagnosis; cardiac infarction; cerebral embolism.

                                                                                                                                                                                                                                                                                                ;
 in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzelaner's, Parkinson's disease, Huntingon's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, extivity, chemotactic/chemokinetic activity, chemotactic/chemokinetic activity, and thrombolytic activity, and and thrombolytic activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                       Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glycoprotein Ib; glycokallidin; detection; antithrombotic; binding; von Willebrand factor; bottrocetin; chimeric protein; immunoglobulin; thrombotic disease; diagnosis; cardiac infarction; cerebral embolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ishii K;

                                                                                                                                                                                                                                                              ö
A method has been developed for the detection of binding between the von Willebrand factor and glycoprotein Ib or of the binding inhibition, in which the von Willebrand factor immobilised in a reactor reacts with glycoprotein Ib in the presence of a binding inducer to promote binding between the von Willebrand factor and glycoprotein Ib. This method is for the detection of glycokallidin as a means of thrombotic disease diagnosis e.g. for cardiac infarction and cerebral embolism, and also for screening substances with anti-thrombotic activity for the prevention and treatment of thrombotic diseases. The method is direct, convenient and quantitative, with reproducibility, and there is no need to construct a monoclonal antibody for the assay. The present sequence represents a human glycoprotein Ib/mouse immunoglobulin gamma 2a Fc chimeric protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A substitution in platelet glycoprotein ib alpha (Leucine 57 to Phenylalanine) underlies a form of Bernard-Soulier disease. The mutated glycoprotein can be used in compositions to inhibit platelet aggregation/adheslon. The glycoprotein may be labelled used as an imaging agent and may also be bound to a thrombolytic agent, preferably tissue plasminogen activator (tPA), (pro) urokinase, streptokinase, anisoylated plasminogen streptokinase activator complex, tPA analogues or a protease, allowing localisation

The mutated glycoprotein can be used in compositions to inhibit platelet agregation/adhesion. The glycoprotein may be labelled used as an imaging agent and may also be bound to a thrombolytic agent, preferably tissue plasminogen activator (tPA),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Platelet glycoprotein Ib alpha with an amino acid substn at position 57 - has reduced reactivity with von Willebrand factor, and can be used to inhibit platelet aggregation and inhibition
                                                                                                      ;

DNA encoding platelet glyco:protein Ib alpha mutant Phe57 -
introduced into platelets to reduce aggregation and reactivity with
von Willebrand factor, also probe for diagnosis of Bernard-Soulier
                                                                                                                         Platelet glycoprotein-Ib-alpha; GPIba; mutaqenesis; point mutation; von Willebrand factor; blood disorder; platelet disorder; protein engineering; Bernard-Soulier disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A substitution of T for C at position 259 in the DNA sequnce of GPID-alpha leads to the replacement of Phe for Leu at residue 87 of the mature GPID-alpha molecule. This mutated GPID-alpha protein is less reactive with von Willebrand factor, a characteristic of the autosomal recessive bleeding disorder,
                                                                                                   Mutated platelet glycoprotein-Ib-alpha GPIba protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB 17; Length 610; 8.8;

N;Alternate names: hypothetical protein 06612
C;Species: Saccharomyces cerevisiae
C;Date: 12-Uul-1996 #sequence_revision 12-Jul-1996 #text_change 05-Nov-1999
C;Accession: S67265
B;Delius, H.; Hebling, U.; Hofmann, B.
Submitted to the Protein Sequence Database, July 1996
A;Reference number: S67261
A;Accession: S67265

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                internalin proteins homolog lmo2027 (imported) - Listeria monocytogenes (strain EGD-e)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hypothetical protein F18F4.240 - Arabidopsis thaliana
NiAlternate names: hypothetical protein FIC12.60
C; Specias: Arabidopsis thaliana (mouse-ear cress)
C; Date: 23-Apr-1999 #sequence_revision 23-Apr-1999 #text_change 31-Jan-2000
C; Accession: T05322; T04898
R; Bevan, M.; Terryn, N.; Ardiles, W.; Buysshaert, C.; Dasseville, R.; De Clerck, R.; Eewes, H.W.; Mayer, R.F.x.; Schueller, C.
submitted to the Protein Sequence Database, April 1998
A; Reference number: 215408
A; Reference number: 215408
A; Residues: 1-1232 <BEV>
A; Molecule type: DNA
A; Residues: 1-1232 <BEV>
A; Residues: 1-1232 <BEV>
